Key words: heterogeneous materials, multiscale materials, multiphase materials, multifunctional materials.

ABSTRACT

The Minisymposium focuses on non-conventional techniques for solid mechanics, including experimental, theoretical and computational aspects. The attention is focused on heterogeneous/multiscale/multiphase/multifunctional materials, and their behaviour especially in the framework of coupled field problems.

Topics:

• Non-conventional theoretical techniques for description of heterogeneous/multiscale/multiphase/multifunctional materials:
  o fractional continuum mechanics,
  o tolerance and non-asymptotic modelling,
  o peridynamics,
  o fractal media,
  o nonlocal continuum,
  o relativistic continuum mechanics, etc.

• Non-conventional techniques for solving coupled field problems for heterogeneous/multiscale/multiphase/multifunctional materials (computational aspects including implementation and hardware/software point of views).

• new set-ups for experimental testing of heterogeneous/multiscale/multiphase/multifunctional materials (miniaturised equipment, digital imaging, etc.)
